

There are times when growing the bacteria up in the tablets can be useful. In practice for most environments it is not needed although there will be times when it is worth trying. Our powdered products can be used in a similar fashion.

Start with a tank with a lid on it that you can close.

Add 30 kgs of molasses (Jaggery juice OK)

Add 5 kg of a nitrate source (NA or K)

Add 100 grams of Yeast extract (whole yeast OK)

Add 100 grams of a commercial enzyme source

Add 100 grams of a mineral source

Add 2 liters of fish hydrolysate

Mix well with about 500 liters of clean water. This could be drinking water without the chlorine. Important that they start out with the water free of other bacteria. OK to use pond water if chlorinated before use and dechlorinated.

NO AERATION

Add 10 tablets.

Ferment for 4 days. When the PH drops to 3.5 it is ready for use.
